

ABSTRACT

Process for managing a memory in a television receiver and television receiver

5

10 Television receiver furnished with a memory (21,22,23) for receiving service data comprising a processing module (11) which correlates usage criteria received together with the service data and storage criteria characterizing the memory or memories of the receiver. By correlating the two criteria, the module determines the conditions of storage.

 Advantageously, a reorganizing module (12) can process the content of the memory so as to free some space in order to store new service data.

15

 The invention also relates to the storage process.
